

Digitalized Heat Systems Management

*A Cooperation Between
e-globe solutions AG and electrojoule AG*

What are the Benefits of a Digitalized Heating System?

If existing or new heating systems are equipped with sensors, the building owner, property manager or homeowner receives transparency, cost efficiency and control over their heating system. The constant monitoring records the data and the diagnosis indicates when there is a need for action. This new form of heating and service management thus has a significant advantage: The service technician only comes into action when he is really needed.

The focus is on the following points:

- ✓ Reduction of operational costs
- ✓ Increase efficiency in service fulfillment
- ✓ Optimization and transparency of the heating system
- ✓ Lowering of CO₂-Emissions

The company *electrojoule* has developed a new, innovative business model that offers added value for homeowners, property managers, but also for heating and plumbing companies. The sensors are used to introduce diagnostics for the heating system, which creates transparency and pro-

vides those involved with information about when a repair or maintenance must be carried out, but also how a heating system can be optimized or when a heating system needs to be repaired.

With the collaboration of *electrojoule* and *e-globe solutions*, our software **godoo**[®] is used together with the ERP-modules **godoo Heatsystems**[®] and **godoo Property Management**[®] in order to offer fully integrated work processes, mobile data transfer and optimized heating management.

e-globe solutions is specialized in the digitalisation of work processes. In close cooperation with our customers, we develop and operate tailor-made software solutions.

We are looking forward to your contact.
